

# 321 Principle - Appendix of Examples and Case Studies

## **Example A1: Proton Structure**

Property: Quark Flavor. Proton = Up, Up, Down (uud). Result: Two matching states and one inverse state.

## **Example A2: Neutron Structure**

Property: Quark Flavor. Neutron = Down, Down, Up (udd). The inversion changes position while preserving the pattern.

## **Example A3: Family Sex Distribution**

Father, Mother, Son or Father, Mother, Daughter. In either arrangement, two entities share one state while the third represents the inverse state.

## **Example A4: Mathematics and Science Interests**

Brother and Evan interested in math/science. Sister not interested. Pattern: Yes, Yes, No.

## **Example A5: Overseas Travel**

Brother and Evan travelled overseas. Sister has not. Pattern: Yes, Yes, No.

## **Example A6: Eyeglasses**

Evan and Sister wear glasses. Brother does not. Pattern: Yes, Yes, No.

## **Example A7: Marriage Status**

Brother married. Evan and Sister unmarried. Pattern: Yes, No, No.

## **Example A8: Employer-Employee-Customer**

Different economic properties create rotating anti-nodes. Example: lower prices = Employer Yes, Customer Yes, Employee No.

## **Example A9: Buyer-Seller-Government**

For lower taxes: Buyer Yes, Seller Yes, Government No.

## **Example A10: Labor-Capital-Consumer**

Different incentives produce alternating node and anti-node roles.

## **Bridge Node Example B1**

Scientist, Public, and Science Communicator. The bridge node transfers information across knowledge boundaries.

### **Bridge Node Example B2**

Executives, Developers, and Project Manager. The bridge facilitates communication without necessarily being the anti-node.

### **Bridge Node Example B3**

Government, Public, and Disclosure Communicator. The bridge translates information between groups.

### **Core Hypothesis**

Interconnected 321 relationships form a constraint network. The network may identify missing dependencies, bridge nodes, and predict unknown information by reducing possibility space.
